

Fix for Flicker

Flicker changed its format to only use https:// (instead of <http://>). This caused requests from Luna to just spin and never resolve when doing an **External Media Search** from the **LUNA Viewer**. This is the fix for that problem.

There is no need to stop the tomcat service just unzip the attached javascript file EMOWrapperFlickr.js and replace the file in LUNA/tomcat/luna_apps/luna.war/js/onlineMediaSearch

This can be done on all versions of LUNA
Flickr's api now requires https and we have made the adjustments in this file.
